

Backend Engineering Assignment – Digital Banking System

You have recently been employed as a Backend Engineer at a start-up bank (the name will be assigned by NibssByPhoenix). As the sole backend engineer, you are responsible for designing and building the core backend system of the bank.

Objective

Develop a functional backend system that supports customer onboarding, account management, and core banking operations by integrating with the APIs provided by NibssByPhoenix.

Requirements

1. Customer Onboarding System

Design and implement a complete onboarding workflow for bank customers.

- Integrate with the BVN/NIN (no real bvn/nin is allowed) onboarding endpoints provided by NibssByPhoenix.
- Ensure that:
 - A customer must successfully create either BVN or NIN before calling account creation endpoint.
 - Account creation is only allowed after successful onboarding and verification.

2. Account Creation

Create bank accounts for each successfully onboarded customer.

- Each customer must have a maximum of **one (1) account**.
- Upon account creation:
 - Each account is pre-funded with **₦15,000** to enable testing and transactions.

3. Core Banking Operations

Ensure that customers can perform the following operations:

- **Name Enquiry**
Verify recipient details before initiating a transfer.
- **Funds Transfer**
 - Intra-bank transfers (within your bank)
 - Inter-bank transfers (to other banks)
- **Account Balance Check**
- **Transaction Status Check**

Testing Note:

You may perform transfers:

- Between accounts you have created, or
- To accounts created by your colleagues.

4. Transaction History & Data Privacy

Implement transaction tracking and enforce strict data privacy.

- Each customer must be able to:
 - View only their own transaction history.
- Ensure proper data isolation:
 - No customer should have access to another customer's data.

5. NibssByPhoenix API Integration

Use the provided API documentation from NibssByPhoenix.

To get started:

- Call the onboarding endpoint and provide:
 - Your email address
 - Your company (bank) name
- You will receive API credentials via email.
- Use these credentials to authenticate and access other endpoints.
